Cosmic strings

- Symmetry breaking phase transitions in the early Universe \rightarrow topological defects.
- Cosmic strings well-motivated phenomenon that arise when axial or cylindrical symmetry is broken → line-like discontinuities in the fabric of the Universe.
- Although we have not yet observed cosmic strings, we have observed string-like topological defects in other media, e.g. ice and liquid crystal.
- Cosmic strings are distinct to the fundamental superstrings of string theory.
- However, recent developments in string theory suggest the existence of macroscopic superstrings that could play a similar role to cosmic strings.
- The detection of cosmic strings would open a new window into the physics of the Universe!

Figure: Optical microscope photograph of a thin film of freely suspended nematic liquid crystal after a temperature quench. Credit: Chuang et al. (1991).

Observational signatures of cosmic strings

- Spacetime about a cosmic string is canonical, with a three-dimensional wedge removed (Vilenkin 1981).
- Strings moving transverse to the line of sight induce line-like discontinuities in the CMB (Kaiser & Stebbins 1984).
- The amplitude of the induced contribution scales with Gμ, the string tension.

Continuous wavelets on the sphere

- First natural wavelet construction on the sphere was derived in the seminal work of Antoine and Vandergheynst (1998) (reintroduced by Wiaux 2005).
- Construct wavelet atoms from affine transformations (dilation, translation) on the sphere of a mother wavelet.
- The natural extension of translations to the sphere are rotations. Rotation of a function *f* on the sphere is defined by

 $[\mathcal{R}(\rho)f](\omega) = f(\rho^{-1}\omega), \quad \omega = (\theta, \varphi) \in S^2, \quad \rho = (\alpha, \beta, \gamma) \in SO(3).$

• How define dilation on the sphere?

 The spherical dilation operator is defined through the conjugation of the Euclidean dilation and stereographic projection Π:

 $\mathcal{D}(a)\equiv\Pi^{-1}\,d(a)\,\Pi$.

• How define dilation on the sphere?

• The spherical dilation operator is defined through the conjugation of the Euclidean dilation and stereographic projection Π :

 $\mathcal{D}(a) \equiv \Pi^{-1} d(a) \Pi .$

Wavelets on the sphere

String tension estimation

Continuous wavelets on the sphere

- First natural wavelet construction on the sphere was derived in the seminal work of Antoine and Vandergheynst (1998) (reintroduced by Wiaux 2005).
- Construct wavelet atoms from affine transformations (dilation, translation) on the sphere of a mother wavelet.
- The natural extension of translations to the sphere are rotations. Rotation of a function *f* on the sphere is defined by

$$[\mathcal{R}(\rho)f](\omega) = f(\rho^{-1}\omega), \quad \omega = (\theta, \varphi) \in S^2, \quad \rho = (\alpha, \beta, \gamma) \in SO(3).$$

How define dilation on the sphere?

• The spherical dilation operator is defined through the conjugation of the Euclidean dilation and stereographic projection II:

 $\mathcal{D}(a) \equiv \Pi^{-1} d(a) \Pi .$

Figure: Stereographic projection.

Continuous wavelets on the sphere

 Wavelet frame on the sphere constructed from rotations and dilations of a mother spherical wavelet Φ:

 $\{\Phi_{a,\rho} \equiv \mathcal{R}(\rho)\mathcal{D}(a)\Phi : \rho \in \mathrm{SO}(3), a \in \mathbb{R}^+_*\}.$

• The forward wavelet transform is given by

$$W^{\!\!\!\!f}_{\Phi}(a,
ho)=\langle f,\Phi_{a,
ho}
angle=\int_{\mathbb{S}^2}\mathrm{d}\Omega(\omega)f(\omega)\;\Phi^*_{a,
ho}(\omega)\;,$$

where $d\Omega(\omega) = \sin \theta \, d\theta \, d\varphi$ is the usual invariant measure on the sphere.

- Fast algorithms essential (for a review see Wiaux, JDM & Vielva 2007)
 - Factoring of rotations: JDM et al. (2007), Wandelt & Gorski (2001)
 - Separation of variables: Wiaux et al. (2005)
- The inverse wavelet transform given by

$$f(\omega) = \int_0^\infty \frac{\mathrm{d}a}{a^3} \int_{\mathrm{SO}(3)} \mathrm{d}\varrho(\rho) W^{\!\!\!/}_\Phi(a,\rho) \left[\mathcal{R}(\rho)\widehat{L}_\Phi \Phi_a\right](\omega) \ ,$$

provided wavelets satisfy an admissibility property.

• BUT...

Continuous wavelets on the sphere

 Wavelet frame on the sphere constructed from rotations and dilations of a mother spherical wavelet Φ:

 $\{\Phi_{a,\rho} \equiv \mathcal{R}(\rho)\mathcal{D}(a)\Phi : \rho \in \mathrm{SO}(3), \, a \in \mathbb{R}^+_*\}.$

The forward wavelet transform is given by

where $d\Omega(\omega) = \sin \theta \, d\theta \, d\varphi$ is the usual invariant measure on the sphere.

Wavelets on the sphere

String tension estimation

Motivation for using wavelets to detect cosmic strings

 Adopt the scale-discretised wavelet transform on the sphere (Wiaux, JDM et al. 2008), where we denote the wavelet coefficients of the data d by

 $\begin{bmatrix} W_{j\rho}^{d} = \langle d, \Psi_{j\rho} \rangle \\ \rho \in SO(3). \end{bmatrix}$ for scale $j \in \mathbb{Z}^{+}$ and position

• Consider an even azimuthal band-limit *N* = 4 to yield wavelet with odd azimuthal symmetry.

Figure: Example wavelet.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

● Wavelet transform yields a sparse representation of the string signal → hope to effectively separate the CMB and string signal in wavelet space.

Wavelets on the sphere

String tension estimation

Motivation for using wavelets to detect cosmic strings

• Adopt the scale-discretised wavelet transform on the sphere (Wiaux, JDM *et al.* 2008), where we denote the wavelet coefficients of the data *d* by

 $\underbrace{W_{j\rho}^{d} = \langle d, \Psi_{j\rho} \rangle }_{\rho \in SO(3).}$ for scale $j \in \mathbb{Z}^{+}$ and position

• Consider an even azimuthal band-limit *N* = 4 to yield wavelet with odd azimuthal symmetry.

Learning the statistics of the CMB and string signals in wavelet space

- Need to determine statistical description of the CMB and string signals in wavelet space.
- Calculate analytically the probability distribution of the CMB in wavelet space:

$$\mathbf{P}_{j}^{c}(W_{j\rho}^{c}) = \frac{1}{\sqrt{2\pi(\sigma_{j}^{c})^{2}}} \exp\left(-\frac{1}{2}\left(\frac{W_{j\rho}^{c}}{\sigma_{j}^{c}}\right)^{2}\right), \quad \text{where} \quad (\sigma_{j}^{c})^{2} = \langle W_{j\rho}^{c}W_{j\rho}^{c}^{*}\rangle = \sum_{\ell m} C_{\ell} |(\Psi_{j})_{\ell m}|^{2}.$$

• Fit a generalised Gaussian distribution (GGD) for the wavelet coefficients of a string training map (*cf.* Wiaux *et al.* 2009):

$$\mathsf{P}_{j}^{s}(W_{j\rho}^{s} \mid G\mu) = \frac{\upsilon_{j}}{2G\mu\nu_{j}\Gamma(\upsilon_{j}^{-1})} \exp\left(-\left|\frac{W_{j\rho}^{s}}{G\mu\nu_{j}}\right|^{\upsilon_{j}}\right),$$

with scale parameter ν_j and shape parameter υ_j .

Learning the statistics of the CMB and string signals in wavelet space

- Compare distribution learnt from the training simulation (string2) with the distribution of the testing simulation (string1).
- Distributions in close agreement.

Spherical wavelet-Bayesian string tension estimation

- We take a Bayesian approach to string tension estimation.
- Perform Bayesian string tension estimation in wavelet space, where the CMB and string distributions are very different.
- For each wavelet coefficient the likelihood is given by

$$\mathbb{P}(W^d_{j\rho} \mid G\mu) = \mathbb{P}(W^s_{j\rho} + W^c_{j\rho} \mid G\mu) = \int_{\mathbb{R}} dW^s_{j\rho} \, \mathbb{P}^c_j (W^d_{j\rho} - W^s_{j\rho}) \, \mathbb{P}^s_j (W^s_{j\rho} \mid G\mu) \; .$$

• The overall likelihood of the data is given by

$$\mathbb{P}(W^d \mid G\mu) = \prod_{j,\rho} \mathbb{P}(W^d_{j\rho} \mid G\mu) \; ,$$

where we have assumed each wavelet coefficient is independent.

- The wavelet coefficients are not independent but to incorporate the covariance of wavelet coefficients would be computationally infeasible.
- Instead, we compute the correlation length of wavelet coefficients, and only fold into the likelihood calculation wavelet coefficients that are at least a correlation length apart.
- Empirically we have found this approach to work well.

Wavelets on the sphere

String tension estimation

Spherical wavelet-Bayesian string tension estimation

• We compute the string tension posterior $P(G\mu | W^d)$ by Bayes theorem:

$$\mathsf{P}(G\mu \mid W^d) = \frac{\mathsf{P}(W^d \mid G\mu) \mathsf{P}(G\mu)}{\mathsf{P}(W^d)} \propto \mathsf{P}(W^d \mid G\mu) \mathsf{P}(G\mu) \; .$$

Figure: Posterior distribution of the string tension (true $G\mu = 9 \times 10^{-7}$).

Bayesian evidence for strings

- Compute Bayesian evidences to compare the string model M^s discussed so far to the alternative model M^c that the observed data is comprised of just a CMB contribution.
- The Bayesian evidence of the string model is given by

$$E^{s} = \mathbb{P}(W^{d} \mid \mathbb{M}^{s}) = \int_{\mathbb{R}} d(G\mu) \mathbb{P}(W^{d} \mid G\mu) \mathbb{P}(G\mu) .$$

• The Bayesian evidence of the CMB model is given by

$$E^{c} = \mathbf{P}(W^{d} \mid \mathbf{M}^{c}) = \prod_{j,\rho} \mathbf{P}_{j}^{c}(W_{j\rho}^{d}) .$$

• Compute the Bayes factor to determine the preferred model:

 $\Delta \ln E = \ln(E^s/E^c) = \ln E^s - \ln E^c .$

$G\mu / 10^{-7}$	2	3	4	5	6	7	8	9
$\Delta \ln E$	-278	-233	-164	-56	104	341	677	1132

Table: Log-evidence differences for a particular simulation.

- Developed a hybrid wavelet-Bayesian method to test for the existence of cosmic strings.
- Perform analysis in wavelet space where the string and CMB signals have very different statistical distributions.
- ToDo: Recover denoised string maps (cf. Wiaux et al. 2009).
- ToDo: Assess the sensitivity of our approach on more realistic simulations.
- ToDo: Apply to Planck observations to test for the existence of cosmic strings!
